

## Caption list

Figure 1. nP-GC $\times$ GC group type separation of a diesel. For a better understanding elution zones of saturates, aromatics, diaromatics and triaromatics are plotted. Bands of C<sub>13</sub>, C<sub>14</sub> and C<sub>15</sub> alkylbenzenes are represented with straight lines. Experimental conditions are reported in Table 1.

Figure 2. rP-GC $\times$ GC group type separation of a diesel. The pattern describes elution zones of saturates, aromatics, diaromatics and triaromatics in a reversed order compared to nP-GC $\times$ GC. Bands of C<sub>13</sub>, C<sub>14</sub> and C<sub>15</sub> alkylbenzenes are represented with straight lines. Experimental conditions are reported in Table 1.

Figure 3. Separation between saturates (S) and aromatics (A) in nP-GC $\times$ GC and in rP-GC $\times$ GC. Chromatograms correspond to one modulation cycle of the raw chromatogram at the elution time of anthracene.

Figure 4. GC $\times$ GC detailed group type separation of a diesel: elution zones of saturates, aromatics, diaromatics and triaromatics are plotted according to the number of carbon atoms. The number inside each zone indicates the number of carbon atoms of the alkyl chain or alkyl groups.

Figure 5. Composition of the diesel: distribution of hydrocarbons per chemical class and per number of carbon atoms.

Figure 6. GC $\times$ GC simulated distillation of the diesel for each chemical group.

Figure 7. Comparison of simulated distillation obtained by GC $\times$ GC and by ASTM D2887.
