S1. Dilute gas viscosity and thermal conductivity

The dilute gas viscosity is obtained from

$$\eta^o = \frac{5}{16} \left(\frac{mk_B T}{\pi} \right)^{\frac{1}{2}} \frac{1}{\sigma^2 \Omega^{(2,2)*}} \quad (\text{S1-1})$$

where m is the molecular mass, k_B is the Boltzmann constant, σ is one of the Lennard-Jones parameters, and $\Omega^{(2,2)*}$ is a collision integral.

For the binary mixture,

$$\eta_{\text{mix}}^o = \frac{1 + Z_\eta}{X_\eta + Y_\eta} \quad (\text{S1-2})$$

where the parameters X_η , Y_η , Z_η is given by

$$X_\eta = \frac{x_1^2}{\eta_1^o} + \frac{2x_1x_2}{\eta_{12}^o} + \frac{x_2^2}{\eta_2^o} \quad (\text{S1-3})$$

$$Y_\eta = \frac{3}{5} A^* \left\{ \frac{x_1^2}{\eta_1^o} \frac{m_1}{m_2} + \frac{2x_1x_2}{\eta_{12}^o} \frac{(m_1 + m_2)^2}{4m_1m_2} \frac{(\eta_{12}^o)^2}{\eta_1^o \eta_2^o} + \frac{x_2^2}{\eta_2^o} \frac{m_2}{m_1} \right\} \quad (\text{S1-4})$$

$$Z_\eta = \frac{3}{5} A^* \left\{ x_1^2 \frac{m_1}{m_2} + 2x_1x_2 \left[\frac{(m_1 + m_2)^2}{4m_1m_2} \left(\frac{\eta_{12}^o}{\eta_1^o} + \frac{\eta_{12}^o}{\eta_2^o} \right) - 1 \right] + x_2^2 \frac{m_2}{m_1} \right\} \quad (\text{S1-5})$$

in which x_i denotes the molar fractions of components i , m_i denotes the molecular mass of component i , and η_i^o denotes the dilute gas viscosity of components i . And the binary interaction dilute gas viscosity

$$\eta_{12}^o = \frac{5}{16} \left(\frac{2m_1m_2k_B T}{\pi(m_1 + m_2)} \right)^{\frac{1}{2}} \frac{1}{\sigma_{12}^2 \Omega^{(2,2)*}} \quad (\text{S1-6})$$

where the subscript ‘12’ means the property of binary mixture of components 1 and 2.

The dilute gas thermal conductivity is represented by the sum of the translational and internal terms,

$$\lambda^o = \lambda^{o,\text{tr}} + \lambda^{o,\text{int}} \quad (\text{S1-7})$$

The translational term

$$\lambda^{o,\text{tr}} = \lambda^{o,\text{CE}} = \eta^o \cdot \frac{15R}{4M} = \frac{75}{64} \left(\frac{k_B^3 T}{\pi m} \right)^{\frac{1}{2}} \frac{1}{\sigma^2 \Omega^{(2,2)*}} \quad (\text{S1-8})$$

The internal term

$$\lambda^{o,\text{int}} = f^{\text{int}} \eta^o \cdot \frac{c_p^o - 2.5R}{M} \quad (\text{S1-9})$$

For the mixtures, the translational term

$$\lambda_{\text{mix}}^{\text{o,tr}} = 4 \cdot \frac{\begin{vmatrix} L_{11} & L_{12} & x_1 \\ L_{21} & L_{22} & x_2 \\ x_1 & x_2 & 0 \end{vmatrix}}{\begin{vmatrix} L_{11} & L_{12} \\ L_{21} & L_{22} \end{vmatrix}} \quad (\text{S1-10})$$

where the relevant determinant elements, L_{ij} is given by

$$L_{ii} = -\frac{4x_i^2}{\lambda_i^{\text{o,tr}}} - \sum_{\substack{k=1 \\ k \neq i}}^2 \frac{2x_i x_k \left[\frac{15}{2}m_i^2 + \frac{25}{4}m_k^2 - 3m_k^2 B^* + 4m_i m_k A^* \right]}{(m_i + m_k)^2 A^* \lambda_{ik}^{\text{o,tr}}} \quad (\text{S1-11})$$

$$L_{ij} = \frac{2x_i x_j m_i m_j}{(m_i + m_j)^2 A^* \lambda_{ij}^{\text{o,tr}}} \left(\frac{55}{4} - 3B^* - 4A^* \right) \quad (\text{S1-12})$$

in which $\lambda_i^{\text{o,tr}}$ is the thermal conductivity of components i , $\lambda_{ij}^{\text{o,tr}}$ is the binary interaction thermal conductivity. And the binary interaction thermal conductivity

$$\lambda_{ij}^{\text{o,tr}} = \frac{75}{64} \left(\frac{(m_i + m_j)k_B^3 T}{2\pi m_i m_j} \right)^{\frac{1}{2}} \frac{1}{\sigma_{ij}^2 \Omega^{(2,2)*}} \quad (\text{S1-13})$$

The internal term

$$\lambda_{\text{mix}}^{\text{o,int}} = \frac{x_1 \lambda_1^{\text{o,int}}}{x_1 + x_2 \cdot \frac{\lambda_1^{\text{o,tr}}}{\lambda_{12}^{\text{o,tr}}}} + \frac{x_2 \lambda_2^{\text{o,int}}}{x_1 \cdot \frac{\lambda_2^{\text{o,tr}}}{\lambda_{12}^{\text{o,tr}}} + x_2} \quad (\text{S1-14})$$

A^* and B^* in the formulations above are given by the recurrence relations among the reduced collision integrals,

$$A^* = \frac{\Omega^{(2,2)*}(T^*)}{\Omega^{(1,1)*}(T^*)} \quad (\text{S1-15})$$

$$B^* = \frac{5\Omega^{(1,2)*}(T^*) - 4\Omega^{(1,3)*}(T^*)}{\Omega^{(1,1)*}(T^*)} \quad (\text{S1-16})$$

And the collision integrals are calculated using the correlations proposed by Neufeld et al. [31]

$$\Omega^{(l,s)*} = A \cdot (T^*)^{-B} + C \cdot \exp(-DT^*) + E \cdot \exp(-FT^*) + G \cdot \exp(-HT^*) \quad (\text{S1-17})$$

where A to H are coefficients and given in Table S1, and T^* is the reduced temperature,

$$T^* = \frac{k_B T}{\varepsilon} \quad (\text{S1-18})$$

in which ε is a Lennard-Jones parameter. The values of Lennard-Jones parameters for each fluid are given in Table S2. The combination rules for Lennard-Jones parameters are applied for σ_{ij} and ε_{ij} :

$$\sigma_{ij} = (\sigma_i + \sigma_j) / 2 \quad (\text{S1-19})$$

$$\varepsilon_{ij} = (\varepsilon_i \varepsilon_j)^{1/2} \quad (\text{S1-20})$$

S2. Residual entropy derived from the CPA equation of state

The residual entropy is derived using the CPA equation of state

$$\begin{aligned}
 s^{\text{res}}(T, v) &= s^{\text{ig}}(T, v) - s(T, v) = \int_{\infty}^v \left[\frac{R}{v} - \left(\frac{\partial p}{\partial T} \right)_v \right] dv \\
 &= R \cdot \ln \frac{v}{v-b} + \frac{a_0}{b} \cdot \left(\frac{d\alpha}{dT} \right) \cdot \ln \frac{v}{v+b} \\
 &\quad + R \cdot \sum_i x_i \sum_{S_i} \left(\ln X_{S_i} + \frac{1-X_{S_i}}{2} \right) + RT \cdot \sum_i x_i \sum_{S_i} \left[\left(\frac{1}{X_{S_i}} - \frac{1}{2} \right) \left(\frac{\partial X_{S_i}}{\partial T} \right)_v \right]
 \end{aligned} \tag{S2-1}$$

where b is the co-volume parameter, a_0 is the energy parameter, α is a temperature-dependent parameter of which the expression is given by Yang et al. [30], and X_{Si} is the association fraction defined as the molar fraction of molecules of component i that are not bonded at site S.

For the mixture, the parameters a and b are obtained using the van der Waals mixing rules:

$$a_0 = \sum_i \sum_j x_i x_j a_{ij}, \quad a_{ij} = \sqrt{a_i a_j} (1 - k_{ij}), \quad b = \sum_i x_i b_i \tag{S2-2}$$

where k_{ij} is the binary interaction parameter.

Elliot combining rule yields the association strength between sites on the molecules of components i and j

$$\Delta_{ij} = \sqrt{\Delta_i \Delta_j} \tag{S2-3}$$

The values of parameters of the CPA equation of state are given by Refs. [7, 9] and listed in Tables S3 and S4 for the readers' convenience.
